Introduction

This document is a supplement to the instructions for the tool **RaceXL**.

The full instructions for the tool can be found at:

<https://github.com/AmitZlatkin/Race-to-The-Technion-Excel-Maker/blob/main/Instructions/Instructions-en.pdf>

The document contains an example layout for “The Race to the Technion” and is followed by a JSON configuration file, available at the following link:

<https://github.com/AmitZlatkin/Race-to-The-Technion-Excel-Maker/blob/main/Instructions/Example-Race-Config-en.json>

Together with the JSON file, this document explains how to infer a JSON configuration file from a race’s layout. For convenience, the activities are formatted in the following way, to make the JSON very apparent:

[#] **[name]**:

- **[location]**
- [information, from which the value of **makeWorksheet** will be inferred]
- [information, from which the value of **numberTable** will be inferred]
- [information, from which the value of **pointsPerRow** will be inferred]

The questions:

1. [the questions, from which the value of **rows** will be inferred]

Along with the activity’s information, the inferred values for the JSON configuration will be shown at the appropriate locations.

Note: In the real race layout, these parameters don’t have to be stated so explicitly.

1. People Quiz: → name = "People Quiz"

- Located at the Odyssey office. → location = "The Odyssey office"
- A separate sheet is needed. → makeWorksheet = true
- The team either guesses the person or does not. → numberTable = false
- Each person is worth 2 points. → pointsPerRow = 2

The questions:

1. The author of the theory of General Relativity (**Albert Einstein**).
 2. The person who can make onions cry, who has counted to infinity... twice, and who is generally considered the strongest human ever or the peak of humanity.
Hint: An actor. (**Chuck Norris**).
 3. The first prime minister of the state of Israel (**David Ben-Gurion**).
 4. The mathematician who proved Noether's theorem (**Emmy Noether** ((ha-ha))).
 5. The first woman in space (**Valentina Tereshkova**).
 6. The professor of Physics 1m, Physics 2, Physics 2mm at the Technion, who is regarded as one of the best teachers at the Technion (**Dr. Hanna Martiskainen**).
- rows = 6

2. Song Completion: → name = "Song Completion"

- Located at the Main Library. → location = "The Main Library"
- A separate sheet is needed. → makeWorksheet = true
- Only the first word is read, and then the team can try to guess the song.
- If they fail, the next word is revealed.
- They can also choose to get another word immediately.
- This continues until the team guesses the song or there are no more words not underlined and in parentheses.
- Every additional word deducts 1 point. If they didn't guess the song, they get 0 points.
- The station's manager is responsible for correctly typing the points the team gets for each song. → numberTable = true
- Each song is initially worth 5 points.
→ pointsPerRow = 0 (just a precaution, the number will be typed manually)

The questions:

1. Never Gonna Give You Up... (Never Gonna Let You Down).
 2. It's the final countdown... (Tu-du-du-duuu).
 3. It's my life... (It's now or never).
 4. Tu tu tu-tu... (Max Verstappen).
 5. I came in like a... (Wrecking Ball).
- rows = 5

3. Human Pyramid: → name = "Human Pyramid"

- Located at the ASAT Grass. → location = "The ASAT Grass"
- Each team makes a human pyramid, and their supervisor sends a photo to the race's moderators, titled with their team number.
- The moderators then "Judge" the pyramid based on creativity, symmetry, and the percentage of the team's members in it, and give a score out of 30.
- The moderators then type the score into the main score sheet in this activity's row and the team's column, directly adding it to the team's total.

→ makeWorksheet = false

→ numberTable = false (just a precaution)

→ pointsPerRow = 0 (just a precaution)

→ rows = 0 (just a precaution)
